It seems impossible to get everyone together. Given that we *have* to make progress. You should own getting the best deal from Web that you can. I would focus on the client software even though I agree with you that getting client and server would be nice.

My view is that parallel activity right now would be best. We'll soon know what we can get out of MCS and that will help us understand how we should deal with the whole picture.

Novell is continuing to flake out so it seems that we should get going with Web. Novell has called me and wants to proceed (again!), but I don't trust them any more. However, I will continue to work that side of things.

I suggest you try to get a letter of intent on paper that we could look at. We can then review it.

thanks,
jim

Why would you even think of fixing any of these? Do you really think it will increase sales by even 1%? You do know it will increase test effort and add risk. I just don't understand why you would even consider this.

Mack

Subject: MS-DOS 5 Bugs to fix in Astro
Date: Thursday, July 09, 1992 2:46PM

We are focused on shipping Astro with minimal changes to MS-DOS 5 files, but we need to ensure we consider all serious MS-DOS 5 bugs (serious = Data Loss/hang).

If you know of any data loss MS-DOS 5 bug (perhaps fixed in Jaguar), which is not in the Astro bug db and should be considered, please notify me (SMALL R) and I will see that it is considered.

If you know of any other bugs which you feel strongly that we should fix in Astro, please tell me also.

FYI: The following bugs have already been copied from the Jaguar and MS-DOS 5.1 DBs, per Mikedr's suggestions:

- 335 \$CreateTemp File hangs DOS 5
- 336 DIR OF EMPTY ERIMO DRIVE IS FLAKEY
- 338 Bad data returned by \$Read
- 339 Hang/Wierdness with loadhigh and small UMB left
- 340 PSS(CIS): FCB I/O Error

Eric.
